The /fulfillment view at http://localhost:5174/fulfillment displays mock data for its inventory trackers and B2B target rosters by architectural design. Here is a breakdown of why this is the case and how the current implementation operates:

1. Architectural Design & Current Phase Under the current Phase 2 roadmap (documented in ROADMAP.md), the datastore schema inside zone3_datastore (see schema.sql) only defines three primary tables: tenants, threads, and messages.

There are no tables or schemas allocated for tracking live inventory weights (sacks, kilos) or scraped business leads. Consequently, there are no backend routes built to serve dynamic inventory weights.

2. Interactive Simulation & The Rule of Supremacy To allow stakeholders to audit the business rules before full system automation:

The inventory numbers (d2cRoastedCount and b2bGreenCount) are wired to interactive React states in FulfillmentDashboard.jsx . You can click the Simulation Adjuster buttons (+100 kg, -100 kg, etc.) at the bottom of the progress tracks to test the Rule of Supremacy math (where D2C roasted sales exceeding the 1,000kg allocation automatically shrink the display targets of unconfirmed green B2B wholesale capacity). 3. What IS Live: Lead Hunter Outbound Dispatch Although the roster list of coffee shops (e.g., Lot Sixty One, Bocca Coffee) is hardcoded, the action trigger is fully wired to the backend API:

When you highlight a shop on the roster and click the [Initialize Lead Hunter for ...] button, the dashboard performs a live asynchronous POST request (as of Sprint 5.3): javascript

fetch('http://localhost:3000/api/hitl/dispatch', { method: 'POST', body: JSON.stringify({ sovereign_key: activeSovereignKey, target_phone: selectedLead.phone, lead_source: 'lead_hunter_b2b', intent: 'outbound_prospecting' }) }) This triggers the live Node D: Broker Agent outbound sequence inside the background execution container in zone6_execution and transitions the UI status to an optimistic Dispatched state to prevent double-outreach.

Note: we will use the shopify api to track inventory. I will add the green beans to the inventory, but not display it.
